TK_61: Rerun of RNAseq and RIBOseq datasets from samples induced with 2-5A/polyI:C

Hernan Lorenzi

7/17/2023

PI: Nick Guydosh

Point of Contact: Agnes Karasik Contact email: agnes.karasik@nih.gov

Summary: The goal of this project is to recalculate Log2FC for RNAseq and RIBOseq datasets from samples induced with 2-5A/polyI:C, using read-count tables based on exon or CDS features.

Results

Link to filtered differential expression tables with shrinkage Link to unfiltered differential expression tables with shrinkage Link to unfiltered differential expression tables with no shrinkage

CDS counts

Load RNAseq CDS data

```
all <- read.delim2("./data/cdsrna_round.csv", sep = ",", header = TRUE, row.names = 1, comment.char = c

# Keep table with Ensemble IDs and gene Symbols
gene_symbols <- replace_gene_acc_by_symbol_ids(rownames(all))
ensembl_to_symbol <- as.data.frame(cbind("Ensembl_ID" = rownames(all), "gene_name" = gene_symbols), row

# Load metadata
metadata <- read.delim2("./data/Metadata.txt", sep = "\t", row.names = 1, header = T)

# keep only samples that are present in all
metadata <- metadata[colnames(all),]

# Add total read counts and sample id columns to metadata
metadata <- cbind(metadata, Read_counts =colSums(all), Sample_id = rownames(metadata))

# Agnes wanted to keep all genes in the analysis, including all 0 genes
#Remove all zero rows
# all <- remove_all_zero_rows(all, min_total_count = 0)
```

Analysis of expression data using DESeq2 - CDS

```
# Convert metadata to factors
for (variable in c("Sequencing_pool", "Read_length", "Machine", "Genotype", "Group", "Colection_time",
   metadata[,variable] <- as.factor(metadata[,variable])
}

# Subset metadata and count tables by Data
meta_one_cds <- subset(metadata, metadata$Dataset == "one")
all_one_cds <- all[, rownames(meta_one_cds)]</pre>
```

I created a new column in metadata (Group_gt_ind) that concatenates the info from Genotype and Inducer columns so coefficients include genotype info.

```
dir.create(path = "./Plots", showWarnings = F)
dir.create(path = "./DE", showWarnings = F)
meta_one_cds$Group_gt_ind <- factor(paste0(meta_one_cds$Genotype, meta_one_cds$Inducer))</pre>
```

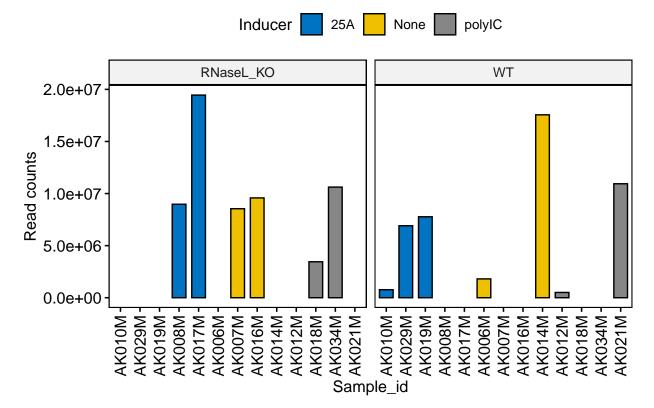

I also added a new column (Read_depth) to tag samples with High or Low sequencing depth so this factor can be controlled for in the design formula.

The design formula use in DESeq2 is the following:

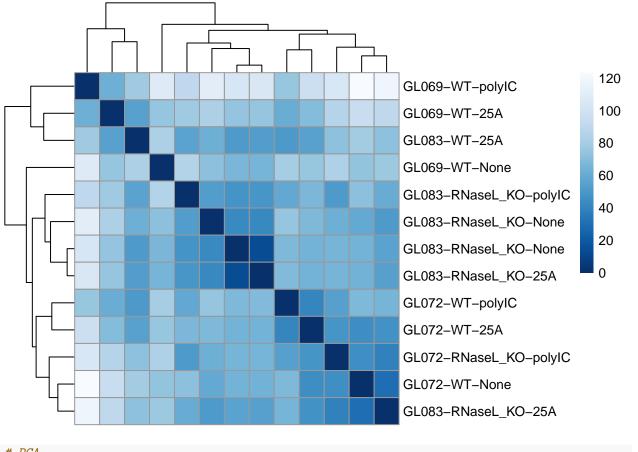

```
design = ~ Read_depth + Group_gt_ind
```

Exploratory analysis with DESeq object- CDS

Total read counts

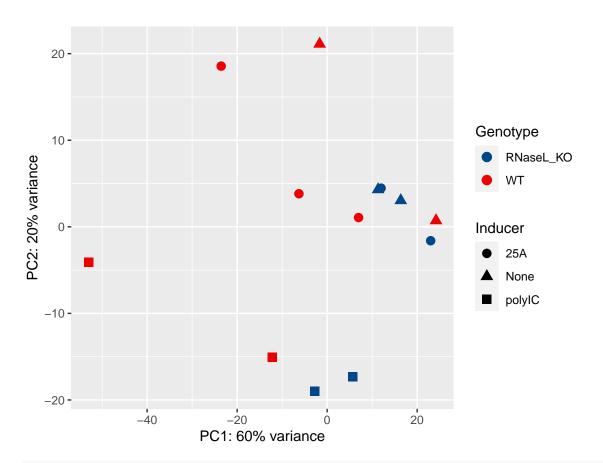

```
# Normalize counts
rlog.one <- rlog(dds.one.cds, blind=FALSE)</pre>
# Keep genes with at least O reads total across samples
keep <- rowSums(counts(dds.one.cds)) >= 0 # Agnes wanted to keep all genes for the analysis
dds.one.cds <- dds.one.cds[keep,]</pre>
# Calculate distances between samples
sampleDists <- dist(t(assay(rlog.one)))</pre>
# Plot inter-sample distances
old.par <- par(no.readonly=T)</pre>
sampleDistMatrix <- as.matrix(sampleDists)</pre>
rownames(sampleDistMatrix) <- paste(rlog.one$Sequencing_pool, rlog.one$Genotype, rlog.one$Inducer, sep=
colnames(sampleDistMatrix) <- NULL</pre>
colors <- colorRampPalette( rev(brewer.pal(9, "Blues")) )(255)</pre>
pheatmap(sampleDistMatrix,
         clustering_distance_rows=sampleDists,
         clustering_distance_cols=sampleDists,
         col=colors)
```

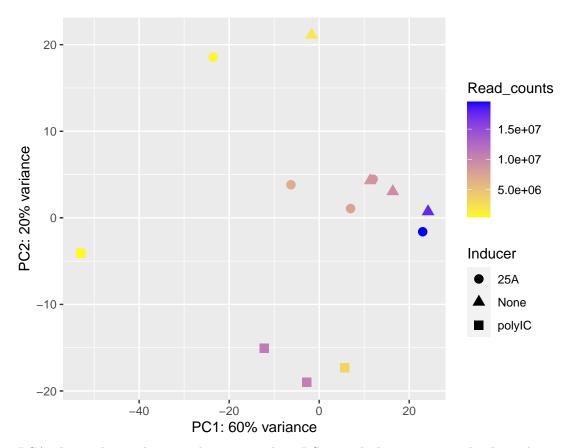

```
# PCA
my_top_genes = 540

pcaData <- plotPCA(rlog.one, intgroup=c("Genotype", "Inducer"), returnData=TRUE, ntop = my_top_genes)
percentVar <- round(100 * attr(pcaData, "percentVar"))
y.coords = c(min(pcaData$PC1, pcaData$PC2), max(pcaData$PC1, pcaData$PC2))
x.coords = y.coords
p1 <- ggplot(pcaData, aes(PC1, PC2, color=Genotype, shape=Inducer)) +
    geom_point(size=3) + scale_color_lancet() +
    xlab(paste0("PC1: ",percentVar[1],"% variance")) +
    ylab(paste0("PC2: ",percentVar[2],"% variance")) +
    coord_fixed(ratio = (max(pcaData$PC1)-min(pcaData$PC1))/(max(pcaData$PC2)-min(pcaData$PC2)))

ggsave("Plots/pca_dataset_1_Induc_gt_cds.pdf", plot = p1)
p1</pre>
```

```
pcaData <- plotPCA(rlog.one, intgroup=c("Read_counts", "Inducer"), returnData=TRUE, ntop = my_top_genes
percentVar <- round(100 * attr(pcaData, "percentVar"))
p2 <- ggplot(pcaData, aes(PC1, PC2, color=Read_counts, shape=Inducer)) +
    geom_point(size=3) +
    xlab(paste0("PC1: ",percentVar[1],"% variance")) +
    ylab(paste0("PC2: ",percentVar[2],"% variance")) +
    coord_fixed(ratio = (max(pcaData$PC1)-min(pcaData$PC1))/(max(pcaData$PC2)-min(pcaData$PC2))) + scale_
ggsave("Plots/pca_dataset_1_Induc_read_counts_cds.pdf", plot = p2)
p2</pre>
```

PCA plots indicate that samples separated on PC1 mostly by sequencing depth, within treatments and genotypes. This implies that sequencing depth has to be controlled for by including this factor in the design formula.

Filtering out poorly-expressed genes (less than 20 reads across all samples) - CDS

```
# Keep genes with at least 10 reads total across samples
keep <- rowSums(counts(dds.one.cds)) >= 0 # Agnes wanted to keep all genes
dds.one.cds <- dds.one.cds[keep,]</pre>
```

Spliting DESeq object based on genotype - CDS

```
dds.one.cds.wt <- dds.one.cds[ , dds.one.cds$Genotype == "WT"]
dds.one.cds.wt$Genotype <- droplevels( dds.one.cds.wt$Genotype)
dds.one.cds.wt$Group_gt_ind <- droplevels( dds.one.cds.wt$Group_gt_ind)
dds.one.cds.wt$Group <- droplevels( dds.one.cds.wt$Group)

dds.one.cds.ko <- dds.one.cds[ , dds.one.cds$Genotype == "RNaseL_KO"]
dds.one.cds.ko$Genotype <- droplevels( dds.one.cds.ko$Genotype)
dds.one.cds.ko$Group_gt_ind <- droplevels( dds.one.cds.ko$Group_gt_ind)
dds.one.cds.ko$Group <- droplevels( dds.one.cds.ko$Group)</pre>
```

Calculate differential expression for WT - CDS

```

Exonic counts

Load data - exons

```
all <- read.delim2("./data/read_counts_exonic_RNaseL.csv", sep = ",", header = TRUE, row.names = 1, com
# Make sure read counts are numeric and rounded to O decimals
all.tmp <- as.data.frame(lapply(all, function(x){ round(as.numeric(x), digits = 0)} ))</pre>
rownames(all.tmp) <- rownames(all)</pre>
all <- all.tmp
# Keep table with Ensemble IDs and gene Symbols
gene_symbols <- replace_gene_acc_by_symbol_ids(rownames(all))</pre>
ensembl_to_symbol <- as.data.frame(cbind("Ensembl_ID" = rownames(all), "gene_name" = gene_symbols), row
# Load metadata
metadata <- read.delim2("./data/Metadata.txt", sep = "\t", row.names = 1, header = T)
# keep only samples that are present in all
metadata <- metadata[colnames(all),]</pre>
# Add total read counts and sample id columns to metadata
metadata <- cbind(metadata, Read_counts =colSums(all), Sample_id = rownames(metadata))</pre>
# Agnes wanted to keep all genes in the analysis, including all 0 genes
#Remove all zero rows
#all <- remove all zero rows(all, min total count = 0)
```

Analysis of expression data using DESeq2 - exons

```
# Convert metadata to factors
for (variable in c("Sequencing_pool", "Read_length", "Machine", "Genotype", "Group", "Colection_time",
   metadata[,variable] <- as.factor(metadata[,variable])
}
# Subset metadata and count tables by Data
meta_one_exon <- subset(metadata, metadata$Dataset == "one")
all_one_exon <- all[, rownames(meta_one_exon)]</pre>
```

I created a new column in metadata (Group_gt_ind) that concatenates the info from Genotype and Inducer columns so coefficients include genotype info.

I also added a new column (Read_depth) to tag samples with High or Low sequencing depth so this factor can be controlled for in the design formula.

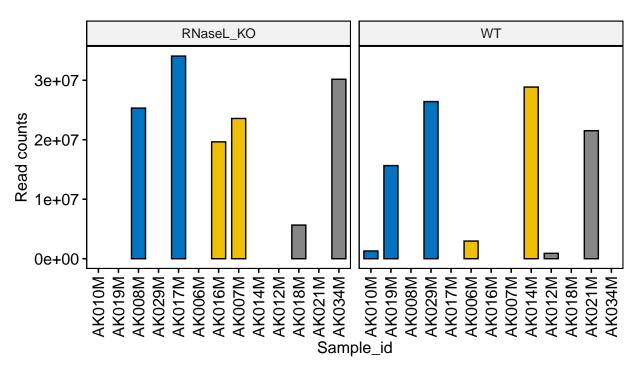

The design formula use in DESeq2 is the following:

```
design = ~ Read_depth + Group_gt_ind
```

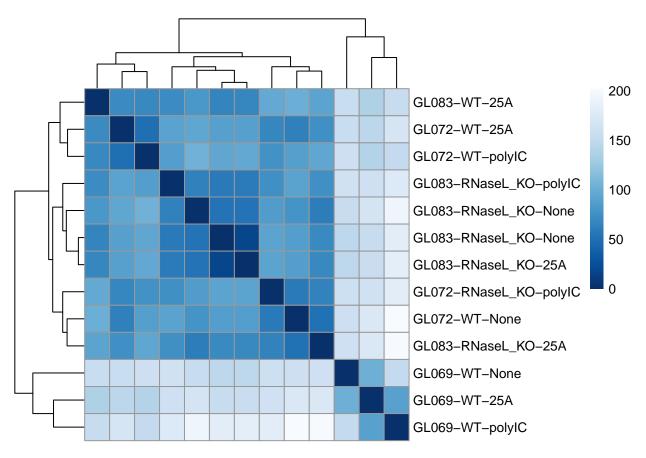

Exploratory analysis with DESeq object- exons

Total read counts

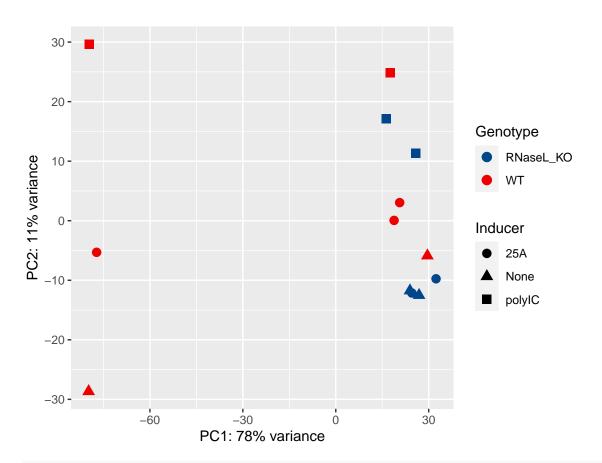

```
# Normalize counts
rlog.one <- rlog(dds.one.exon, blind=FALSE)</pre>
# Keep genes with at least 20 reads total across samples
keep <- rowSums(counts(dds.one.exon)) >= 0 # Agnes wanted to keep all genes for the analysis
dds.one.exon <- dds.one.exon[keep,]</pre>
# Calculate distances between samples
sampleDists <- dist(t(assay(rlog.one)))</pre>
# Plot inter-sample distances
old.par <- par(no.readonly=T)</pre>
sampleDistMatrix <- as.matrix(sampleDists)</pre>
rownames(sampleDistMatrix) <- paste(rlog.one$Sequencing_pool, rlog.one$Genotype, rlog.one$Inducer, sep=</pre>
colnames(sampleDistMatrix) <- NULL</pre>
colors <- colorRampPalette( rev(brewer.pal(9, "Blues")) )(255)</pre>
pheatmap(sampleDistMatrix,
         clustering_distance_rows=sampleDists,
         clustering_distance_cols=sampleDists,
         col=colors)
```

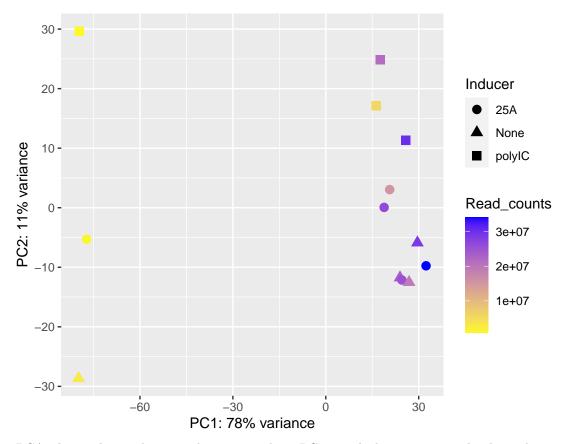

```
# PCA
my_top_genes = 540

pcaData <- plotPCA(rlog.one, intgroup=c("Genotype", "Inducer"), returnData=TRUE, ntop = my_top_genes)
percentVar <- round(100 * attr(pcaData, "percentVar"))
y.coords = c(min(pcaData$PC1, pcaData$PC2), max(pcaData$PC1, pcaData$PC2))
x.coords = y.coords
p1 <- ggplot(pcaData, aes(PC1, PC2, color=Genotype, shape=Inducer)) +
    geom_point(size=3) + scale_color_lancet() +
    xlab(paste0("PC1: ",percentVar[1],"% variance")) +
    ylab(paste0("PC2: ",percentVar[2],"% variance")) +
    coord_fixed(ratio = (max(pcaData$PC1)-min(pcaData$PC1))/(max(pcaData$PC2)-min(pcaData$PC2)))

ggsave("Plots/pca_dataset_1_Induc_gt_exon.pdf", plot = p1)
p1</pre>
```

```
pcaData <- plotPCA(rlog.one, intgroup=c("Read_counts", "Inducer"), returnData=TRUE, ntop = my_top_genes
percentVar <- round(100 * attr(pcaData, "percentVar"))
p2 <- ggplot(pcaData, aes(PC1, PC2, color=Read_counts, shape=Inducer)) +
    geom_point(size=3) +
    xlab(paste0("PC1: ",percentVar[1],"% variance")) +
    ylab(paste0("PC2: ",percentVar[2],"% variance")) +
    coord_fixed(ratio = (max(pcaData$PC1)-min(pcaData$PC1))/(max(pcaData$PC2)-min(pcaData$PC2))) + scale_
ggsave("Plots/pca_dataset_1_Induc_read_counts_exon.pdf", plot = p2)
p2</pre>
```

PCA plots indicate that samples separated on PC1 mostly by sequencing depth, within treatments and genotypes. This implies that sequencing depth has to be controlled for by including this factor in the design formula.

Filtering out poorly-expressed genes (less than 20 reads across all samples) - exons

```
# Keep genes with at least 10 reads total across samples
keep <- rowSums(counts(dds.one.exon)) >= 0 # Agnes wanted to keep all genes
dds.one.exon <- dds.one.exon[keep,]</pre>
```

Spliting DESeq object based on genotype - exons

```
dds.one.exon.wt <- dds.one.exon[ , dds.one.exon$Genotype == "WT"]
dds.one.exon.wt$Genotype <- droplevels( dds.one.exon.wt$Genotype)
dds.one.exon.wt$Group_gt_ind <- droplevels( dds.one.exon.wt$Group_gt_ind)
dds.one.exon.wt$Group <- droplevels( dds.one.exon.wt$Group)

dds.one.exon.ko <- dds.one.exon[ , dds.one.exon$Genotype == "RNaseL_KO"]

```

RIBOseq counts

Load data - RIBOseq

```
all <- read.csv("./data/cdsfoot_round.csv", row.names = 1)

# Keep table with Ensemble IDs and gene Symbols
gene_symbols <- replace_gene_acc_by_symbol_ids(rownames(all))
ensembl_to_symbol <- as.data.frame(cbind("Ensembl_ID" = rownames(all), "gene_name" = gene_symbols), row

# Load metadata
metadata <- read.delim2("./data/Metadata_footprint.txt", sep = "\t", row.names = 1, header = T)

# Sort tables so metadata and read counts match order
metadata<- metadata[match(colnames(all), rownames(metadata)),]

# Add total read counts and sample id columns to metadata
metadata <- cbind(metadata, Read_counts = colSums(all), Sample_id = rownames(metadata))

# Agnes wanted to keep all genes in the analysis, including all 0 genes
#Remove all zero rows
# all <- remove all zero rows(all, min total count = 0)
```

Analysis of expression data using DESeq2 - RIBOseq

```
# Convert metadata to factors
for (variable in c("Read_length", "Sequencing_pool", "Date_1st_submitted", "Species", "Strain_name", "Genoty
   metadata[,variable] <- as.factor(metadata[,variable])
}
# Subset metadata and count tables by Data
meta_one_RS <- metadata
all_one_RS <- all</pre>
```

I created a new column in metadata (Group_gt_ind) that concatenates the info from Genotype and Inducer columns so coefficients include genotype info.

I also added a new column (Read_depth) to tag samples with High or Low sequencing depth so this factor can be controlled for in the design formula.

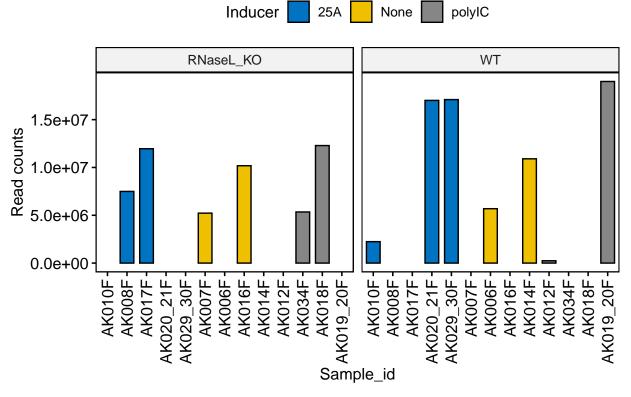

The design formula use in DESeq2 is the following:

```
design = ~ Read_depth + Group_gt_ind
```

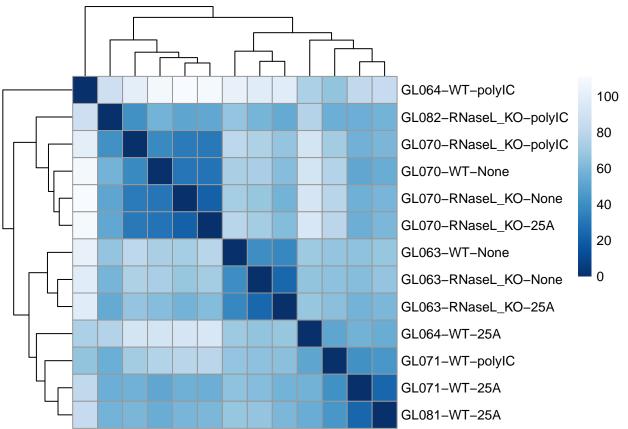

```
# add new factors (Group_gt_ind and Read_depth (high > 10M reads / Low < 10M reads))
meta_one_RS$Group_gt_ind <- factor(pasteO(meta_one_RS$Genotype, meta_one_RS$Inducer))
meta_one_RS$Read_depth <- 'High'
meta_one_RS$[meta_one_RS$Read_counts < 10e6,]$Read_depth <- 'Low'
meta_one_RS$Read_depth <- as.factor(meta_one_RS$Read_depth)</pre>
# Adding read_depth in design to control for read_depth
```

Exploratory analysis with DESeq object- RIBOseq

Total read counts

```
# Normalize counts
rlog.one <- rlog(dds.one.RS, blind=FALSE)</pre>
```

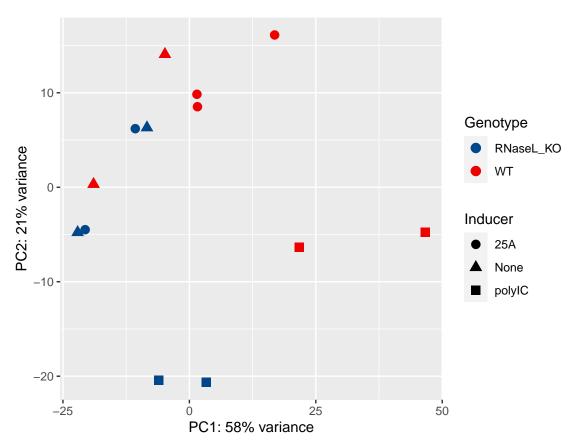

```
# PCA
my_top_genes = 500

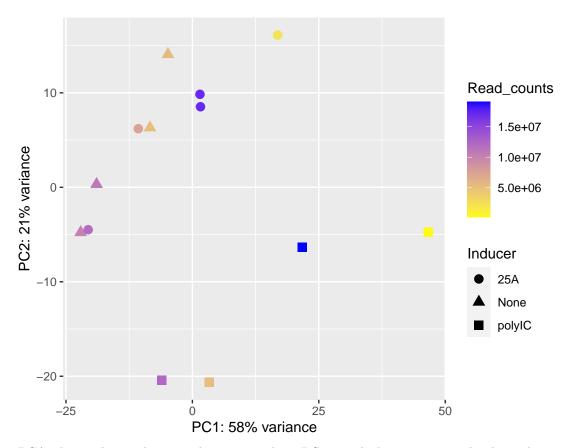

pcaData <- plotPCA(rlog.one, intgroup=c("Genotype", "Inducer"), returnData=TRUE, ntop = my_top_genes)
percentVar <- round(100 * attr(pcaData, "percentVar"))
y.coords = c(min(pcaData$PC1, pcaData$PC2), max(pcaData$PC1, pcaData$PC2))
x.coords = y.coords</pre>
```

```
p1 <- ggplot(pcaData, aes(PC1, PC2, color=Genotype, shape=Inducer)) +
    geom_point(size=3) + scale_color_lancet() +
    xlab(paste0("PC1: ",percentVar[1],"% variance")) +
    ylab(paste0("PC2: ",percentVar[2],"% variance")) +
    coord_fixed(ratio = (max(pcaData$PC1)-min(pcaData$PC1))/(max(pcaData$PC2)-min(pcaData$PC2)))

ggsave("Plots/pca_dataset_1_Induc_gt_RS.pdf", plot = p1)
p1</pre>
```

```
pcaData <- plotPCA(rlog.one, intgroup=c("Read_counts", "Inducer"), returnData=TRUE, ntop = my_top_genes
percentVar <- round(100 * attr(pcaData, "percentVar"))
p2 <- ggplot(pcaData, aes(PC1, PC2, color=Read_counts, shape=Inducer)) +
    geom_point(size=3) +
    xlab(paste0("PC1: ",percentVar[1],"% variance")) +
    ylab(paste0("PC2: ",percentVar[2],"% variance")) +
    coord_fixed(ratio = (max(pcaData$PC1)-min(pcaData$PC1))/(max(pcaData$PC2)-min(pcaData$PC2))) + scale_
ggsave("Plots/pca_dataset_1_Induc_read_counts_RS.pdf", plot = p2)
p2</pre>
```

PCA plots indicate that samples separated on PC1 mostly by sequencing depth, within treatments and genotypes. This implies that sequencing depth has to be controlled for by including this factor in the design formula.

Filtering out poorly-expressed genes (less than 20 reads across all samples) - RIBOseq

```
# Keep genes with at least 10 reads total across samples
keep <- rowSums(counts(dds.one.RS)) >= 0 # Agnes wanted to keep all genes
dds.one.RS <- dds.one.RS[keep,]</pre>
```

Spliting DESeq object based on genotype - RIBOseq

```
dds.one.RS.wt <- dds.one.RS[ , dds.one.RS$Genotype == "WT"]
dds.one.RS.wt$Genotype <- droplevels( dds.one.RS.wt$Genotype)
dds.one.RS.wt$Group_gt_ind <- droplevels( dds.one.RS.wt$Group_gt_ind)
dds.one.RS.wt$Group <- droplevels( dds.one.RS.wt$Group)

dds.one.RS.ko <- dds.one.RS[ , dds.one.RS$Genotype == "RNaseL_KO"]
dds.one.RS.ko$Genotype <- droplevels( dds.one.RS.ko$Genotype)
dds.one.RS.ko$Group_gt_ind <- droplevels( dds.one.RS.ko$Group_gt_ind)
dds.one.RS.ko$Group <- droplevels( dds.one.RS.ko$Group)</pre>
```

Calculate differential expression for WT - RIBOseq

```
# Calculate DE for WT samples
